Numbers and Physics
By Shomit Sirohi

I. Physics – Time and Space – Constant on Earth and in this Solar System, 10 dimensions or so in Time-Space or Time Variable Curvature in General and Special Terms

In fact time and space is constant on earth but in astrophysics which is meant to describe the theory of relativity which in turn means high complexity on relativity which is like a forquiescence and relational element structure broken to elements without relation – just elements, pure elements and their forequiscene which though is in-organised in the sense of in-discernible surreal sheaf of general and special as united in relativity which though astrophysics would say in this voyage of dimensions and infinite time-space movement and journey which is also independent according to proof, is still that time-space here is real and constant and that is because the universe is infinite. Or mathematics argues strictly infinite.

In a poem I am writing here, it explains this as –

Infinitely larger than infinity,

A little larger than the linguistic conception

Of the Universe,

How elements are related,

Is not as elements and relations,

But as pure dispersals,

Imagine the count is surreal,

But also completely in fact,

In-organised.

Numbers and numbers,

Also it is numbers in real fact,

Not anything other than

Set theoretical,

Physics type numbers.

Imagine.

Complex numbers everywhere.
